

Resonance Bastion

Support-channel review • 0.2.7 • 2026-10-08

Development continued beyond the paid-combat review. A focused four-Repair-Node test exposed a discrepancy between the shared channel limit and self-repair. The correction is implemented and verified; no new user decision was required.

Correcting one individual interaction

The blueprint allows two external repair sources per recipient and permits eligible self-repair. The older implementation counted self-repair against the external cap, and could block it entirely when that identity was processed last. The new simulation counts external sources separately, without allowing an extra external source or a second outgoing channel from one Node.

Half-body Node, three neighboring Nodes	v3	v4
External sources plus eligible self	Two sources total	Two external + self
Actual first pulse-cycle repair	12.5 Integrity	18.75 Integrity

Each Node still has one channel at 25 Integrity/sec, pulsing every 0.25 seconds. Both recipient ordering cases work. The final wound remainder can be finished without overheal; restoration contribution equals the actual eligible 400-point injury. Destroyed sources and zero-body recipients cannot heal.

Older attempts retain their exact behavior

New plans capture rb-sim-v4. Retained v1/v2 practice and v3 paid/practice attempts keep their previous rules. The published whole v3 battle, checkpoint and pending-result hashes match exactly. A finalized v4 result advances the save header atomically with rewards and wounds; loading an old save does not rewrite it.

Verification

All 131 unit tests in 29 files and 44 browser checks pass, plus typecheck, lint, formatting, deterministic scenario and production build. Native backup/import verifies both v3 and v4 results through reload, cross-slot rebinding and single-payment finalization. Four deterministic before/after records and source/log hashes are in the ZIP.

Current scope and continuing work

The first Bulwark/Bastion paid C01S01 loop and explicit progression/recovery remain playable development work. Engineer/Medic moving channels, injury-scaled support, trap rearm, wider roster and full pacing remain separate increments. Affordable partial-repair previews are the next small recovery improvement. Physical Lenovo/Android performance and full-roster acceptance remain open.
